

SuperScreen™

**Enterprise-Grade Penetration Testing
for an SMB Price**

What is SuperScreen?

With a cyber-attack occurring every six minutes in Australia, each day businesses are asking themselves "Are we at risk of a security breach?" Traditionally, Penetration Testing has been the answer, but it is expensive, time-consuming, and usually conducted just once a year. This means new vulnerabilities can go undetected for months. SuperScreen from Superloop, is a first-to-market security offering that gives you a fast, simple, cost-effective and automated penetration testing solution which is easily added to any new or existing Superloop corporate internet link.

How SuperScreen Works.

1. Simulates an external attack over your Superloop link
2. It then scans for vulnerabilities and exposures
3. Escalation of privileges is attempted to control your systems
4. An automated report provides detailed remediation steps

Key Benefits: Protect Your Business Continuously and Proactively.

The SuperScreen test is performed on a continuous basis, running monthly to deliver more up-to-date vulnerability results. By adopting Superloop's SuperScreen penetration testing, organisations can maintain a robust security posture proactively and effectively, mitigate risks in a dynamic threat landscape whilst maintaining ongoing compliance.

Reduced Risk Of Breaches	Simplified Reporting and Remediation
SuperScreen automates testing on a monthly basis highlighting any new exposures on your internet facing assets, significantly reducing your risk profile.	SuperScreen's automated reporting summarises the key recommendations and a plan for your IT team on how to resolve them from highest to lowest urgency.
Maintain Compliance and Reduce Costs	
SuperScreen's regular scanning and reporting can support compliance audits, whilst eliminating the need for specialised security skills. At a small, monthly cost of just \$79.99, (excl. GST) you get all the benefits as well as peace of mind from an enterprise-grade penetration testing solution.

How is SuperScreen Delivered?

Superloop have designed SuperScreen to be an easy add-on to your business and enterprise products of Totalbiz and Probiz, providing you with frequent penetration testing against the static IP address(s) that are assigned to your Superloop link(s). The initial information of the service and IP address is automatically inserted into the SuperScreen platform, and an automated test is initiated every month. The SuperScreen platform uses a three-phase 'black-box' approach initially running reconnaissance on exposed assets.

Phase 1 - Attack, Scan and Collect

Phase one includes the collection of exposed port and service information, firewall bypass attacks and open/closed, software and system identification and subsequent vulnerability identification. Application layer scanning and web content management / plug-ins are also scanned for potential vulnerabilities e.g., WordPress. Exploits are launched to try to breach the infrastructure including specific service attacks, SSL/TLS configuration, Malware, DDoS exploit detection, vulnerability and protocol exploits, admin service brute force and command injection.

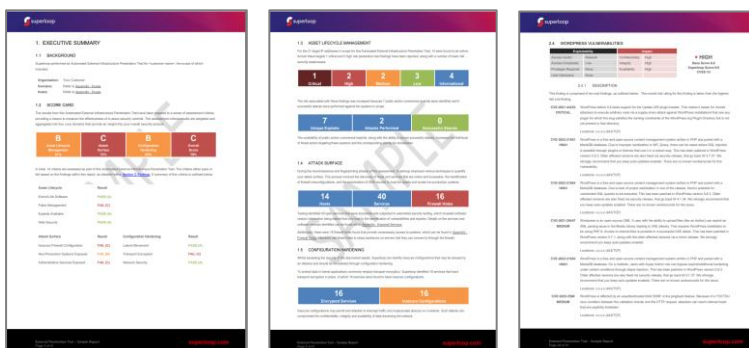

Phase 2 - Privilege Escalation and Control

The second phase attempts to subvert and control the environment through backdoor injection, privilege escalation, credential extraction, password hash cracking and extraction, as well as lateral movement attempts via several mechanisms including Memory Extraction, Pass-The-Hash Attack, Post exploitation of systems and enhanced lateral movement.

Phase 3 - Reporting and Remediation

In the third phase, SuperScreen provides a comprehensive automated report available to customers via their Superloop corporate portal. The executive summary provides a simple score card of the external attack surface, mapping to three main categories -- Asset Lifecycle, Attack Surface and Configuration. This summary makes it easy for IT teams to focus on the specific areas requiring attention with prescriptive recommendations on how to resolve. The Superloop cyber team can also run you through an initial post-test session to clearly articulate the findings.

SuperScreen's automated monthly scanning and reporting provides an easy-to-follow summary that will guide your IT teams to proactively address the most critical vulnerabilities and risks first.
